Q: Binding a DataGridView's cell value to a property of another class I have a DataGridView that I want to use as a master grid and then list contents in child grids by filtering on certain criteria. I have the DataGridView hooked up to a ViewModel and I am able to update the DataGridView when I type into the SearchBox, filtering the data on the master grid. But, I cannot use the DataGridView as a master grid and load Child Grid data at the same time as I am typing into the SearchBox. I'd like to be able to keep the UI updated when the Text property of the SearchBox changes. How can I do this? Here is my MVVM-like code (note the MainWindowViewModel is hooked up to my DataGrid):

```
MainWindowViewModel public MainWindowViewModel() { myModel = new Model(); this.CategoryFilter = "All"; ListViews = new ObservableCollection(); myModel.Load(); }
Model class public IList Load() { IList sortList = new List(); foreach (Category cat in Category) { ISort sort = new Sort(); sort.IsForCategory = cat.IsForCategory; sort.Descending = false; sortList.Add(sort); }
```

What's New in the Adobe Photoshop?

UNIONDALE, NY -- (Marketwired) -- Dec 03, 2016 -- MegaScale Technologies, Inc. (OTC: MESAF), a leader in the design and development of efficient quantum efficient integrated circuits (ICs), is pleased to announce that it has received a MicroLED 2.0 Mo-LED Device from its partners, Adjet Inc. ("ADJET" or "the Company"), a leading supplier of Micro-LEDs and light-emitting diodes (LEDs) based on nanophosphors and quaternary ammonium compounds. The new 2.0 Mo-LED device can be used for more than 10,000 times brighter and 3 times smaller than conventional LED. Micro-LED devices are made from LEDs with a size of about 1 micrometer (1,000 nm). Since the devices are semiconductor devices, they are capable of bearing an extremely high current. This means that the devices can be used for driving the organic light-emitting diode (OLED) display and the backlight in the future. The LED display device is not only more efficient but is also easier to see and can be made thinner than OLED displays. The new LED device created through collaboration between MegaScale and ADJET is comprised of a p-type semiconductor substrate, n-type semiconductor bottom electrode, quantum dot, n-type semiconductor top electrode, p-type semiconductor layer, p-type semiconductor top electrode, n-type semiconductor layer, and n-type semiconductor bottom electrode. The new 2.0 Mo-LED device can be used for more than 10,000 times brighter and 3 times smaller than conventional LED. This means that the new device will be extremely useful in applications requiring high brightness, such as LED-based lighting, display devices, backlight devices, and electroluminescent devices. The new Mo-LED device is expected to be one of the key components for bright and efficient OLED displays in the future. The image above shows the Mo-LED device. About MegaScale Technologies, Inc. MegaScale Technologies, Inc. ("MegaScale") is a semiconductor design and development company specialized in the creation of dedicated analog ICs for radiation detectors. By implementing the user's needs in analog designs, MegaScale is able to provide innovative products to users across a variety of industries including early-warning detection for homeland security and nuclear power industry.
