In CAD, you will be using a program that enables you to define a shape as an entity that can be manipulated and printed in 3D. Commonly, you will also be using a program that enables you to design 2D shapes. In this article, we will be focusing on the 2D aspects of AutoCAD. The basics of 2D CAD are a bit different than the basics of 3D CAD, but the principles are the same. In an AutoCAD drawing, the entities used to define a drawing can be referred to by one of five different types of tools: Entity Creation Tool: This is the tool you use to define the entities that you want to use in your drawing. If you are designing a desk lamp, you would start by defining the dimensions, materials, and point where you want to attach the lamp shade and where you want to place the light. Open the program and open the 'keys.dat' file you extracted in step 2 (the file is made on the 'keys.dat' subfolder). On the 'keys.dat' file, you will see a lot of values. Go to the 'World' tab and, on it, you will see a lot of lines with a number with a '='. There are values for 3D files, 2D files, DXF files and so on. On the 'World' tab, select the value you want and copy it. Go back to the 'Objects' tab. Go to the 'Feature' tab and open 'layer'. Open the 'layer' file you opened on the 'objects' tab. There will be lines with a code of 2 in a row, for example: "#2: BBOX". Go to the 'Objects' tab and select the lines with the code 2 and paste them in the 'Layer' tab. Go back to the 'Layer' tab and change the 'opacity' values to 0 (just click on the desired value and paste '0'). Go back to the 'Objects' tab and select the lines with the code 1 and paste them in the 'Layer' tab. Now change the 'opacity' values to 100. Repeat steps 3 and 4 for the values 1 and 3.
