C++ has been the primary language of AutoCAD development, and many of its core components have been implemented in C++. The result is a heavy-weight application, although most of its UI is graphical. The programming language used for the core of AutoCAD is C++, which has been used since the program's earliest development. However, in recent years, AutoCAD has been available for other programming languages. AutoCAD also supports the following programming languages: Visual Basic Visual C# Visual J# Visual LISP Visual Basic for Applications (VBA) AutoLISP Visual C++ Java The term "object" in the context of AutoCAD is used both to refer to a component and to refer to a class. An AutoCAD component object is an individual data element; for example, a letter, text box, line, arc, drawing, or a mesh. The collection of these individual data elements is often referred to as a component. A class object is a template or pattern for many objects of a particular type; the various AutoCAD object types are created by the compiler when a program is compiled. The term "class" is more widely used in other programming languages. Graphical user interface AutoCAD is a graphical user interface (GUI), and the interface is configurable. At one time there were four main modes of interface (drawing, linking, editing and previewing): In addition, there are also a number of specialized modes: Audio track Block storage Fillet/chamfer Construction DWG render Estimating Erasing Geometry Plotter Print management Registration Raster Segmentation Sheet metal Text Window management XREF When viewed in drawing mode, the application's screen displays a viewport with a canvas. In the canvas are controls, icons, dimensions, drawings, etc. The drawing mode also allows the user to move around the viewport by picking the cursor with the mouse. Tools AutoCAD contains many specialized tools, categorized by their purpose. Each tool has a number of functions, including: Bill of materials, which allows the user to create a bill of materials (BOM), a list of the components of an item to be purchased and a list of the steps involved in the manufacturing process Chalk lines, which create parallel lines which can be used to align one object to another a1d647c40b
