Virtual Sound Card (VSC) is a soundcard emulator that lets you record and broadcast audio from running applications or microphone. Virtual Sound Card (VSC) is a software tool that provides users with a way of recording and broadcasting built-in/microphone sounds and sounds from running applications. The program could be used for many other purposes as well, including audio and video recording from the internet. By granting users full access to their soundcard, Virtual Sound Card allows users to record sounds made by Skype calls, webcams, synthesizers or any other applications. Virtual Sound Card also provides the ability to broadcast and re-broadcast audio which was recorded to another device through the built-in sound card. The most popular types of soundcards on the market are actually known as analog or video soundcards. This is because these types of soundcards were actually used in advanced video equipments such as digital camcorders. Analog soundcards feature PCM output (more commonly known as digital audio) that uses several different bitrates, sample rates, and sound depth, and later re-sampling to fit compatible devices. In other words, to make a clear and distinct sound, these soundcards give all the digital information required for the sound sample. So if you have an analog soundcard, then your computer's soundchip (audio output) will be able to use that specific audio format to send out a sound sample. While video soundcards on the other hand, simply contain a video output. This typically works by encoding analog sound samples into a digital form that the computer and televisions can use. Video soundcards are typically built into digital camcorders, video game consoles, and video renderers. So the question is, if you have a digital soundcard, then how are you supposed to use it? The answer is a software tool called Virtual Sound Card that is designed to help. It is designed to act as a soundcard on your computer's PCM output, and thus allows you to capture and broadcast sound directly from the computer's speakers, microphone, or even an external sound device. So before you dive into setting up Virtual Sound Card you should think about which type of soundcard you have. And if you think you have a soundcard of the type that Virtual Sound Card does not support, then you can still download Virtual Sound Card and use that program to record and broadcast
