Q: How to get a read-only list of structs from a JSON dictionary I'm working with a Json2csharp library that generates C# types from a JSON dictionary. It seems I can't find a way to generate a C# read-only dictionary from the same JSON dictionary. The JSON dictionary has a few items that look like structs. When I query the JSON dictionary for its properties I get back a list of JSON objects. I can't seem to access any of the properties of these objects. The C# types are generated like this: `var domainStructList = Json2CSharp.Json2CSharp.GetTypeInfo(jsonDictionary).Structs.ToList();` Now, a `domainStructList.GetType().Name` will return the type name of the list of structs, but what I want is to be able to access the fields of the structs in the list. What is the easiest way to extract this information into a dictionary? The JSON dictionary is structured like this: `{ "accounts": { "content": { "account_ids": { "ids": [5, 7], "name": "Account 1", "domain": "domain1.com" }, "accounts": [{ "content": { "account_ids": { "ids": [5, 8], "name":`
