His son, Weston, is a delightful little boy who makes his parents so proud — Bradley is so delighted that he posted a video of him and his son dancing together on Instagram. The video features Weston looking excited about dancing and the camera even shows him taking a step back to see if anyone's watching. "He's so proud of himself," Wright-Phillips told the Post. "He was like, 'Put my shoes on, put your shoes on.' I would not have thought in a million years he'd be as good a dancer as he is." Chelsea Flannigan, Weston's mom, told the Post that the young boy was thrilled about joining in the family dance party. "Weston was so excited to participate and we had a really good time!" she told the Post. Wright-Phillips, a talented forward for the Red Bulls, was born in England, but raised in New Jersey. His wife, Natalie, is from the Westchester-New York area, and they have been married since 2013. Weston is an adorable and happy-go-lucky boy who might be the most athletic person in the family. In the little "dad dance" video, Wright-Phillips adds that Weston's Dance Daddy friend, Ali, adds, "I love him!" before he dances away with Weston and his mom. UFSread is a graphical application which can be used to list the files in the Unidata file system. UFSread will also download files from the Unidata file system to the Windows file system. Required Software: You must have Microsoft Windows installed, and an Unidata Explorer (or other UFS partition explorer) window open to access the Unidata file system. Q: Vmware ESXi 4.1.0 - server-wide IP on a single network interface Given a Virtual Machine running on VMWare ESXi 4.1.0 and running a Windows Server inside, is it possible to assign a single physical network interface as the server-wide "default" IP source? In other words, can I make the server listen on one NIC and then resolve the IP address based on that NIC alone? Looking at the documentation, I cannot see a way. A: When I tried to do this on ESXi 4.1, I found that the host-only network does not work very well on ESXi. On my 4.0 host, the built-in host-only network worked perfectly, but ESXi 4.1 has several host-only network issues. When I installed ESXi 4.1 on a vSphere installation, it broke everything. I ended up creating a network with NAT from the server (as an "ESXi server bridge") and added physical adapters to get the machine access to the network.

The UFSRead software allows you to read files from an UFS partition. Partition or disk image files can be created by Windows CD's, with Windows disk management tools or any other tool that creates UFS partitions. Files can be selected directly from the UFS partition or disk image file. The files are read as if they were right on the partition or image file. Files are copied to the current directory on a second drive or to a different directory on a second drive, if desired. The program automatically selects the first twenty files from the partition or image file. This makes it possible to start downloading files without having to first manually scroll to the end of the file list and select the last file. The application provides a list that provides the following information: File name Downloaded file size Downloaded file time Directory Warning! Make a backup copy of the UFS partition or disk image file before downloading and processing the files. UFSread is a lightweight, easy to use program. It is small (3 megabytes) and does not install any files on the hard disk. UFSread Installation: 1. UFSread installation is quick and easy. 2. UFSread can be used from any operating system on the computer. 3. To start UFSread, just double-click on the UFSread icon. 4. No installation is required for using UFSread. 5. To configure the program and specify the drive that contains the UFS image file, you must install UFSread. 6. The installation will take about 10 minutes. 7. When the installation is completed, you must start UFSread. How to: 1. First, you need to create an UFS partition in your hard disk. 2. You have to read the files from the UFS partition and copy them to the Windows file system. 3. When you want to start the download process, open UFSread and select a desired file or files in the UFS partition. 4. When you want to stop the download process, just cancel the download process with an appropriate action. 5. For different languages, UFSread includes different interfaces and different instructions according to the language of the interface. If you cannot use the interface of your
