Q: How to authenticate from client to server? I have a client application that retrieves data from a server. Authentication is done through a username and password. Now, I want to use another authentication system, based on an API key, which is linked to the username and password. I want to maintain the current user's information, but authenticate with a different system. How should I change the client code to authenticate using an API key instead of a username and password? A: You'll need to change the client code to handle the API key. If it's a REST service, you'll probably need to send the key and parse it out in your web service to authenticate. You could also do it by adding an extra parameter in your query string or POST body. Parotidectomies using an endoscopy for the salivary gland.
