You can use this file name for further editing. The Export File Features The Export File Features You can give your image files a template to ensure the correct number of pixels in your export. The Export File window lets you specify the measurement (width and height) of the exported file, the type of paper you wish to use, and the print resolution, or pixel density, in that print. The Print Settings window will take you through all these options. When you select the Print Settings window, you will see all your available options and their default settings. You can export individual images or entire file folders with the Export File function. To Export an Entire

Q: The role of "pare" in "pare l'allumettazione" According to Treccani dictionary we can use pare as a reflexive pronoun and as a partitive article. Besides, I have learnt that it also means "spare". From "un povero ragazzo di Venezia mi ha chiesto di pare l'allumettazione in caso di raffreddamento". it is very difficult for me to understand how it corresponds to spare. A: You're correct, «Pare» can be used both as an reflexive pronoun and as a partitive article. The most common usage of the reflexive pronoun is for habitual activities. E.g. «Pare che guardi in caso di indurimento» (in case of arthritis), «Pare che guardi in caso di raffreddamento». The meaning is a little more subtle that it may appear. What it means is that there is a risk of illness or discomfort. You have to prepare yourself for it. For example, for arthritis, a remedy is to take pills containing antiinflammatory drugs, such as ibuprofen. Similarly, you have to prepare yourself for the risks associated with being cold. To do this, you can use «permetterò l'allumettazione» (I will allow you to turn on the heater) or, using the past participle, «ho lasciato l'allumettazione» (I have turned on the heater).

1. Field of the Invention The present invention relates to a waterproofing technique for use in a thin film magnetic head and other devices. 2. Description of the Related Art Thin film magnetic heads are generally manufactured by stacking a lower shield layer (not shown), a lower core layer (not shown), an upper core layer (not shown), a magnetoresistive layer, a protective film (not shown) and other layers, on a substrate (not shown). By the use of this manufacturing technique, a thin film magnetic head is obtained. Recently, a thin film magnetic head using a magnetoresistive effect is coming to be used in hard disk drives, in particular. In this case, the lower core layer, the magnetoresistive layer and the protective film are formed by a thin film forming technique such as the sputtering, the optical vapor deposition and the electron beam vapor deposition. On the other hand, the upper core layer is formed by a thick film forming technique such as the plating, the vacuum vapor deposition and the sputtering. Since the thin film forming techniques have the problem of the higher cost than the thick film forming techniques, the lower core layer, the magnetoresistive layer and the protective film are generally formed by the thick film forming techniques. As described above, it is common that the upper core layer of the thin film magnetic head is formed by the thick film forming technique, and the lower core layer, the magnetoresistive layer and the protective film are formed by the thin film forming technique. As one of the waterproofing methods for the thin film magnetic head, the vacuum vapor deposition is performed on a lower core layer and an upper core layer made of Al, Cu, Ag, Ni, Pt, Ti, Zr, Nb, Mo, W, Si, La, and so on using a non-evaporable getter (NEG) film (see JP-A-5-32716 and JP-A-7-314836). FIG. 7A and FIG. 7B are sectional views illustrating the conventional method for manufacturing a thin film magnetic head. The FIG. 7A and FIG. 7B illustrate a lower core layer, a magnetoresistive layer and a protective layer, while the FIG. 7A shows the state before an upper core layer is formed, and the FIG. 7B shows the state after the upper core layer is formed. As shown in FIG. 7A and FIG.
