Download The Sims 4 PC FULL Game [Activation Code 2.5.2] GR Game [Full Free Version]Q: Accessing Doxygen generated html file from Python I have built a doxygen documentation project and when it runs I have generated an html file (the documentation itself) containing links to the files in my project. What I would like to know is the best way to access the html file from Python (using Python's built-in website framework or something similar)? It would be really helpful to be able to include the html with my rest of documentation files rather than storing the document locally. A: You can build html from the doxygen output using `pydoxygen.buildhtml(...)` Now: `>>> import pydoxygen >>> pydoxygen.buildhtml('output/example1.html')` You can also just open the file directly: `>>> import sys >>> pydoxygen.buildhtml(sys.argv[1])` Q: How is this quine constructed? In Python, where the `eval()` function allows you to evaluate code, we see this problem: `>>> x = [1, 2, 3, 4, 5, 6, 7] >>> len(eval('[x]'))` 6 When you run `eval()`, it evaluates the literal, which is how the code is constructed (look at the beginning of the output). How is it that the length is 6? A: `>>> x = [1, 2, 3, 4, 5, 6, 7] >>> len(eval('[x]'))` Becomes `>>> [x] [1, 2, 3, 4, 5, 6, 7] >>> len([x])` 6 A: `eval('[x]')` is a function call to the list constructor of the class `[x]` which returns a list with the list `x` as its only element. The `[x]` is a list literal, which itself evaluates to a list in the current environment. A technique for sutureless edge-to-edge mitral valve repair.
