Autodesk 2016 Architectural Desktop.Q: What is the point of defining multiple handlers for C# keyboard events? In the Windows Forms designer on a new form you can choose between keyPreview and keyUp to handle keyPressed events. If you define both, the keyUp handler overrides the keyPressed handler. This is outlined in the documentation The control can also display both a keyPreview event handler and a keyUp event handler. If either the keyPreview event handler or the keyUp event handler fires, the other one is not invoked. This is useful when you want to prevent certain keystrokes that are invalid in the current context. It would seem to me that this would remove any need to code a keyPreview event handler, which is often not as speedy as the keyUp handler since they both invoke the delegate you set. So what is the point of defining both the handlers? What key codes are not caught by the keyUp handler? A: A brief history of Windows event handling. Windows supported two kinds of event handling: c6a93da74d
