Maps APIs further expand the ability to set custom camera settings in the same way that the Google Mapmaker tool does. This is controlled by the

GoogleMap.setMyLocationEnabled and GoogleMap.setMyLocationDisplay methods. The MyLocation icon is displayed in the camera preview when these methods are called. It also displays a marker on the map in the general location of the MyLocation icon. This code snippet shows an example of adding a custom location marker to the map: GoogleMap - Note:

Although the GoogleMap does not need a context to be used, the Android framework does not create a default context (i.e. an activity) for

you. If you use the GoogleMap object in a Fragment or a Service it will work fine, but if you use the GoogleMap object in an activity it will throw an IllegalStateException indicating that you cannot use the GoogleMap object in an activity unless you use a custom context to wrap the activity. Note that the GoogleMap object can be shown to a user only if the device is running Android API level 12 or higher. Older versions of Android will not show the map on your phone. See this guide to see how to use the GoogleMap object on older versions of Android. GoogleMap - The Android API uses points to define the way objects interact, and as a developer you probably will not want points to be displayed. You can use LatLng objects to define the world to which you wish to control, and the system will be responsible for displaying the view.

Gds GoogleMap V8.0.0.0

Map types are used to limit the extent of the map. By default, the map covers the whole world. You can limit the GoogleMap to particular regions. When specifying a map type, a

LatLngBounds object is passed into `GoogleMap.setMapType`. The following code snippet shows how to configure a map with a street map tile set: top left of the map. The constructor for the Marker takes in a title, a Gson object, a custom icon URL and an `OnMarkerClickListener` that can be used to call methods on the `GoogleMap` object.

```
public class MyMarker { private String mTitle; private Gson mGson; private String mIcon; private OnMarkerClickListener mOnClickListener; private Bitmap mIconBitmap; public MyMarker(String title, Gson gson, String icon, OnMarkerClickListener onClickListener) { mTitle = title; mGson = gson; mIcon = icon; mOnClickListener = onClickListener; mIconBitmap = BitmapFactory.decodeResource(getResources(), R.drawable.ic_launcher); } @Override public String toString() { return mTitle; } }
```

Gds
GoogleMap v8.0.0.0 This completes the core functionality of the tutorial. The `MainActivity` class has been modified to connect to a database, retrieve data, use the Google Play Services APIs and allow the user to generate a map with custom markers. Not shown in this

tutorial is support for directions or distance calculations. There are certain limits to the Google APIs as to how much the Google Maps platform can be extended. If you wish to go the distance, the following tutorials will help you implement all the functionality you need:
