

Projects and features to be introduced in Mastercam future releases will include: Mastercam 6 is on track for release in early November 2015; Next iteration of Mastercam 6 with a revamped look; Mastercam X3 for production of end mills is planned for release in February 2016. Mastercam 6 will bring in a new look, enhanced performance, and will also benefit from the GPU/OpenGL 3.2 and OpenCL support on NVIDIA Quadro and AMD FirePro / Radeon Pro graphics cards to increase the already fast performance of the program. Machining is all about precise calculations. Rotating and moving pieces of metal around. For instance, if you are working on the innermost surface of a cylinder, such as the threads, then you could have to first cut the threads, then measure them precisely, then attach them to the rest of the cylinder in the correct geometry. The rotation of the machine usually determines the speed of the cutting tool and where it is placed. This means that it takes a lot of trial and error to get the correct parameters. It is very rare that the machine is set up correctly for a first time process, as the machines aren't usually designed for this kind of use. The process is often repeated multiple times, sometimes causing a lot of waste. This is where Mastercam X3 can help. With Mastercam X3, you can design your job in a planning tool, rotate it, measure it, and place it precisely. Once that job is ready, the machine is configured and ready to go. In the configuration process you can adjust the speed of the tool, what path it takes, how long it takes to complete the path, and so on. This makes the process a lot more efficient. The motion planning is significantly more efficient than when it is done manually.
