This is a very important feature because they want to compare the objects in the list before choosing the most appropriate object. In DynamoDB this feature is called by primary key range scan. I am wondering if it is possible to do it in the Internet Explorer's C# SDK. Is there any way to implement it through the API? A: No, since the SDK is made to target only the "classic" DynamoDB, which does not provide native support for SQL-like queries like that. If you want to support that sort of query, I suggest that you build an application using the REST API and use the.NET RDBMS libraries to create and execute those sort of queries instead.
