Photoshop's "RAW" capability has long since ceased to be shocking, but that doesn't mean it isn't a useful tool. None of today's tools can handle the intricate information that exists within a RAW image. Raw files can contain metadata, exposure information, information about the shots before the image was created, and other specialized information that's too much for other applications to handle. By the time you've processed the raw files and saved them, the information is typically too interwoven for your average designer. While Photoshop and other modern RAW-supporting applications let you do a lot of nifty things with raw images, the process isn't exactly comfortable. Raw files aren't exactly interchangeable between apps, and you won't really be able to access all of Photoshop's capabilities until you've processed them. And that's not even taking into account the fact that you have to convert your raw images from one setting to another, which can make your workflow far more complicated. For anyone who wants to create a large variety of images, manipulation, and other functions that can't be done in other applications, Photoshop's usefulness is unquestioned. But for anyone who doesn't want to spend an hour doing a one-time conversion or having to worry about upgrading when the program is released, Photoshop's usefulness is diminished. Now, a new beta application called Photoshop Share for Review can make the conversion process much quicker by automatically saving your changes to a raw image in place so you can work on it at your leisure.

The new release is being hailed as a small size 'editor' to help designers and users get the best print out of their designs and work. With the release, the primary features of Adobe Photoshop CC have been positioned in the context of the whole of the desktop software or related applications. The new application also allows multiple monitors to be used, for the better and extensive use of the space. In the past versions, users were only able to consume their time and effort in a single monitor because of the unresolvable differences of the Windows or Mac OS. "Photo editing is often a labor-intensive process that involves finding the right tool for each step in the process, and today, we're revolutionizing the way people work by bringing layers, content and the connected devices they use into Photoshop for a single, streamlined workflow. Through these foundational changes we are enabling customers to collaborate and create with confidence on any device and in any surface." A key feature adding even more depth to Photoshop's automated creative workflow is Match Color. In addition, users can selectively remove color variants to preserve the

original version of the image, use the saved learning to rapidly match colors from any surface and even use the custom colors in an existing image as a starting point to create a new color scheme - all with one-click.
