This is a small cross-platform library to help developers create easily consumable APPEND and REPLACE macros.

Typically, these are used to append output to an existing file (file) or replace existing contents (file). Furthermore, you can also control the default output behavior. All of this can be done via some small but powerful function called KEYMACRO. KEYMACRO is the short name for KEYMACRO(KEYMACRO).. The KEYMACRO library allows you to:

- Save your output to a file: this can be done via macro (append or replace) or using a temporary file.
- Enable/disable/modify the "File Cache" (file), which allows you to save the temporary file to the file system.
- Control the behavior of

"Optimizer", which turns on/off the auto-compilation of the files. - Enable/disable the auto-save and auto-delete of files, when using "File Cache". - Provide the function to open/close your saved files (file). - Provide some function to search for files with "file". - Enable/disable the error/warning message box. - Provide the function to send the messages to your chosen window (window). It is possible to use KEYMACRO functions with pre-defined functions, but also with functions that are declared in the program. KEYMACRO is coded in Visual Basic. It is very easy to understand. If you have ever worked with Visual Basic you will be able to create and understand macros almost immediately. KEYMACRO does not depend on any specific language. KEYMACRO is compatible with all the Windows versions (X, Windows 2000, Windows 2003, Windows 7, Windows 8, Windows 10, etc). KEYMACRO can run on the following platform: Windows

Many users will already be familiar with the service, having used it to pay for things in Apple stores, on iTunes and the App Store, and even to make payments at retailers that have signed up for Apple Pay. But now, with iOS 9, the company is open to more merchants to join in with Apple Pay. This will make it easier
