Fortunately, I found a niche for the new format. As you can see, the workflow was simple: I batch-processed a lot of post-processing effects (a process I had been doing for weeks before receiving Lightroom). I did a fair bit of manipulation, using the Clone Stamp tool and to adjust my clone source's brightness and contrast values. They were all kept transparent, so the original color of the original source was not touched. You can use the new file format to import and export PSD files from the Lightroom catalog. You can open, edit and save these files with the new format in future versions of the program. Adobe is claiming the original PSD file will work, with some restrictions. I'll discuss those later. If the PSD editor is your preferred way of working, you'll be glad to hear this update is backward compatible with previous versions of Lightroom. If I had to score the new version of Adobe Photoshop CC, I would award a 4 out of 5. The one core feature that I do miss is "Hide all Adjustments", as there is no longer an option to do so. Apart from that, the tool is still really powerful and, most importantly, as fast as it always has been. By the way, it now runs faster on my Ultrabook, thanks to the SSD upgrade. I don't see any truly major flaws, but there are definitely some minor ones. Like I said, the "Show Previous Versions" feature is quite limited, and as more and more people rely on the cloud, I'd say that's a problem that only Adobe can correct. Alas, there is no word on the Mac version of Photoshop, though it will probably come very soon.
